## Heuristic Evaluation

1. I used heuristic #2 to **match between the system and the real world**. So for instance, the cart you see in the upper right hand corner of the site is not only the accepted convention for shopping sites, it's also meant to represent the real-world activity of shopping, where you would put items you'd like to purchase in a physical cart in the store.

2. I used heuristic #3 to **provide user control and freedom**. At every point in the pages built so far, users can go back, make changes, and add again. For instance, on the pack size selection page, users can click a pack size and unclick it. I'm still working on adding in more features to facilitate user freedom specified in my Figma design.

1 pack

3 pack

6 pack

12 pack

Next >

3. I used heuristic #1 for **visibility of system status**. I created a progress bar which will persist on every page within the 'Order Now' site flow.

## Bugs

1. I created the menu options in the nav bar as a `<ul>` in HTML, and I ran into a problem of random dots appearing in the list on the website, obscuring some of the words. I went to Stack Overflow and discovered that those dots were bullet points, and this was occurring due to the fact that my `list-style-type` was not `none`, in fact, it wasn't specified at all, so I'm sure my list defaulted to bullet points. So I made that quick change in CSS, and the problem was resolved.
2. Items that I needed to be centered on the screen never seemed to reach center when I used `margin: 0 auto;` in CSS. I discovered that this was prolly due to me trying to center a parent `<div>` whose `display` defaulted to `block`, so the elements inside

would not move. I added classes to elements within the `<div>` of interest and set their `display` to `inline-block`, specified width, and height, and then centering seemed to work fine.

3. I did not know how to build out the functionality I specified in my Figma for viewing item details. My design plan was to open an overlay which would give details upon mouse click of an info button. I used [this video](#) as reference to help me, and was able to get the functionality working.

## Brand Identity

I made sure to keep the colors light and use a lot of pink to reflect the joy and warmth of indulging in cinnamon rolls. I'd also like to add in smooth animations at a later point to add to the whimsical nature of the site. I also chose to shorten the company name from Bun Bun Bake Shop to just Bun Bun as a more inviting rebrand.
